Experiment 14 - Experiment to understand feature scaling

Aim:

To understand feature scaling.

Program:

```
import numpy as np
import pandas as pd
from google.colab import drive
drive.mount('/content/drive')
df = pd.read_csv('/content/drive/MyDrive/pre-process_datasample.csv')
df.head()

df.Country.fillna(df.Country.mode()[0], inplace=True)
features = df.iloc[:, :-1].values
label = df.iloc[:, -1].values

from sklearn.impute import SimpleImputer
age = SimpleImputer(strategy="mean", missing_values=np.nan)
Salary = SimpleImputer(strategy="mean", missing_values=np.nan)
age.fit(features[:, [1]])
Salary.fit(features[:, [2]])
SimpleImputer()

features[:, [1]] = age.transform(features[:, [1]])
features[:, [2]] = Salary.transform(features[:, [2]])
from sklearn.preprocessing import OneHotEnProgramr
oh = OneHotEnProgramr(sparse_output=False)

Country = oh.fit_transform(features[:, [0]])
final_set = np.concatenate((Country, features[:, [1, 2]]), axis=1)
from sklearn.preprocessing import StandardScaler
sc = StandardScaler()
sc.fit(final_set)

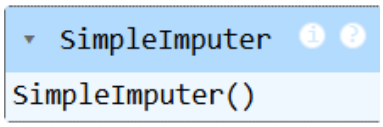

feat_standard_scaler = sc.transform(final_set)
from sklearn.preprocessing import MinMaxScaler
mms = MinMaxScaler(feature_range=(0, 1))
mms.fit(final_set)
```

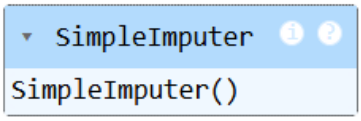

```
feat_minmax_scaler = mms.transform(final_set)
```

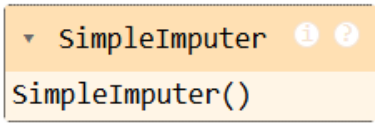

Output:
